## Symptomatic reflux treatment pathway - CLINICIANS

### IMPORTANT

- Clinical decision making always has priority, if treatment is felt to be urgent then it can be initiated sooner than described here but the steps should be followed in sequence and time given for them to have an effect before moving on.
- It is possible that families will have initiated some non-pharmacological measures before seeking medical attention.
- Any baby felt to absolutely need gastric acid suppression medication for reflux may have it if clinically indicated.
